

# SecOps as a service

Start your journey to a secure zero trust environment.

Organizations use modern cybersecurity practices to protect user identities, devices, and corporate data, improving efficiency and compliance. However, most require a roadmap to fully understand how these solutions work and how to implement modern security in your environment.

Additionally, you need visibility to the threats in your IT landscape and a way to automate responses to those threats. Different priorities of the security and operations teams can create a gap, resulting in conflicting efforts and disparate tools. An important step to achieve a modern security model and establish a zero trust environment is by enhancing the collaboration between teams. Together, they can leverage machine learning with behavioral analytics to identify risks, automate responses, and mitigate threats.

## Our certified Microsoft experts can help you with the right solution and bespoke delivery models.

SHI addresses the challenges faced by organizations by leveraging leading solutions like the Microsoft Defender suite of products, providing real-time visibility of potential risks in the environment with automated responses and threat remediation.

We provide a customized roadmap of what should be implemented, and in what order, to achieve a modern security model for both cloud and on-premises resources.

				
Automated defense and response	Machine learning and behavioral analytics	Defender security center		
				
Advanced threat protection	Threat hunting and threat experts	Integration with Intune	Defender for endpoints	Defender for office
				
			Defender for identity	Defender for cloud apps
